## CHEMICAL NOMENCLATURE

The International Union of Pure & Applied Chemists (IUPAC) has established rules for naming chemical compounds (chemical nomenclature). Therefore, uniformity is achieved in chemistry especially in the scientific literature. Different nomenclature rules are used for inorganic and organic compounds.

### INORGANIC NOMECLATURE

#### I. NAMING IONIC COMPOUNDS

**Monoatomic cations** are named by the elemental name followed by ion.

$\text{Ca}^{2+}$  calcium ion

Many transition metal cations have more than one charge. In this case when naming these cations the “stock nomenclature system” is used by writing a roman numeral in parenthesis after the elemental name.

$\text{Fe}^{2+}$ iron (II) ion	$\text{Cu}^{1+}$ copper (I) ion	$\text{Hg}_2^{2+}$ mercury (I) ion
$\text{Fe}^{3+}$ iron (III) ion	$\text{Cu}^{2+}$ copper (II) ion	$\text{Hg}^{2+}$ mercury (II) ion

2

An older method is also used to distinguish between cations that can vary in charge, using the 2 most common oxidation states (“charges”). The Latin root of the elemental name is followed by –ic or –ous. The –ic ending indicates a larger positive charge than –ous.

$\text{Fe}^{2+}$ ferrous ion	$\text{Cu}^{1+}$ cuprous ion	$\text{Hg}_2^{2+}$ mercurous ion
$\text{Fe}^{3+}$ ferric ion	$\text{Cu}^{2+}$ cupric ion	$\text{Hg}^{2+}$ mercuric ion

The older nomenclature is not used much in chemistry texts, but it is used commonly to label chemical bottles containing ionic compounds.

**Monoatomic anions** are named by replacing the end of the element with –ide.

Cl chlorine atom  
 $\text{Cl}^-$  chloride ion

Many anions are **polyatomic ions**. Some of these also end in –ide.

$\text{OH}^-$  hydroxide ion  
 $\text{CN}^-$  cyanide ion

Most **polyatomic ions** are oxyanions meaning they contain oxygen with other elements. If two oxyanions are in a common series, the ion with more oxygens ends in -ate (the originating acid name ends in -ic) and the ion with one less oxygen ends in -ite (the originating acid name ends in -ous).

$NO_3^-$  nitrate ion                       $SO_4^{2-}$  sulfate ion  
 $NO_2^-$  nitrite ion                       $SO_3^{2-}$  sulfite ion

Some **polyatomic anions** form a common series with four different oxyanions.

$ClO_4^-$  perchlorate ion (from perchlorIC acid)  
 $ClO_3^-$  chlorate ion  
 $ClO_2^-$  chlorite ion  
 $ClO^-$  hypochlorite ion (from hypochlorOUS acid)

per\_\_\_ate means the most oxygen atoms in the ion – usually 4

\_\_\_ate means one less oxygen than per\_\_\_ate

\_\_\_ite means one less oxygen than -ate

hypo\_\_\_ite means one less oxygen than -ite (least oxygen atoms in the ion) – usually 1

Hydrogen ion,  $H^+$ , can be added to polyatomic anions one step at a time until a neutral acid is produced. Each added  $H^+$  neutralizes one negative charge.

3

$PO_4^{3-}$  phosphate ion  
 $HPO_4^{2-}$  hydrogenphosphate ion  
 $H_2PO_4^-$  dihydrogenphosphate ion  
 $H_3PO_4$  phosphoric acid

When naming ionic compounds, also known as salts, the cation is named first followed by the name of the anion. The word ion is dropped from each ion name. Subscripts representing how many ions are in the empirical formula are not named with ionic nomenclature, because they can be figured out by logic. So remember with salts DO NOT USE PREFIXES TO NAME THE SUBSCRIPTS.

$CaCl_2$                       Calcium chloride                      **not** calcium dichloride.  
 $Ca_3(PO_4)_2$                       Calcium phosphate                      **not** tricalcium diphosphate

Even though ionic crystalline solids contain ions, the sum of the positive charges equals the sum of the negative charges so the salt crystals are neutral. Since the size of a salt crystal can vary, a neutral empirical formula is used to represent a salt crystal.

$Al_2(SO_4)_3$  the cation is  $Al^{3+}$  and the anion is  $SO_4^{2-}$  so the name is aluminum sulfate.

$Al_2(SO_4)_3$  this neutral empirical formula represents 2  $Al^{3+}$  for every 3  $SO_4^{2-}$  in the salt

To make a neutral formula from ions the crossover method is used.

$Al^{3+}$  and  $SO_4^{2-}$  becomes  $Al_2(SO_4)_3$

The 3 superscript from the aluminum ion will become the subscript for the sulfate and, the 2 superscript from the sulfate will become the subscript on the aluminum atom to produce the neutral salt formula  $Al_2(SO_4)_3$ . When more than one polyatomic ion is needed in the formula, the subscript is placed outside of parenthesis. In the neutral salt formula, superscripted charges are not used to represent ions in the empirical formula. They are omitted. One can tell it is a salt formula because the metal is always first in the formula and the nonmetal is always second in the formula.

## II. NAMING BINARY MOLECULAR COMPOUNDS

Binary molecular compounds contain covalent bonds between two different **nonmetal** atoms. Greek prefixes are used to indicate the number of atoms of each element in the molecule. The Greek prefixes are:

4

**TABLE 1. Prefixes Used in Binary Molecular Compounds**

Prefix	Meaning
Mono	1
Di	2
Tri	3
Tetra	4
Penta	5
Hexa	6
Hepta	7
Octa	8
Nona	9
Deca	10

Common names are still used to name some molecules such as the ones in Table 2.

**TABLE 2. Common name Formula**

Water	H <sub>2</sub> O
Ammonia	NH <sub>3</sub>
Hydrogen peroxide	H <sub>2</sub> O <sub>2</sub>
Nitric oxide	NO
Nitrous oxide	N <sub>2</sub> O

### RULES FOR NAMING BINARY MOLECULAR COMPOUNDS

1. The elemental name of the most metallic atom is written first (the one farther to the left in a period or the one farthest down a group).
2. For the second element in the molecule, the ending is dropped from the elemental name and -ide is added. For example, chlorine becomes chloride.
3. Greek prefixes are used to indicate the number of atoms of each element. If there is only one atom of the first element, then the mono is dropped. If the prefix ends in a or o, and the second element begins with a vowel the a or o is often dropped from the prefix.

Cl<sub>2</sub>O<sub>7</sub> Dichlorine heptoxide

CO<sub>2</sub> Carbon dioxide

5

### III. NAMING ACIDS

Acids are named according to the anion they contain.

<b>Anion ending</b>	<b>Acid name</b>
-ide	hydro_____ic acid
Cl <sup>-</sup>	HCl
chloride	hydrochloric acid
per____ate	per____ic acid
$ClO_4^-$	$HClO_4$
perchlorate	perchloric acid
-ate	_____ic acid
$NO_3^-$	$HNO_3$
nitrate	nitric acid
-ite	_____ous acid
$ClO_2^-$	$HClO_2$
chlorite	chlorous acid

hypo\_\_\_\_\_ite  
 $ClO^-$   
hypochlorite

hypo\_\_\_\_\_ous acid  
 $HClO$   
hypochlorous acid

#### IV. NAMING SOME SIMPLE ORGANIC COMPOUNDS

We will just learn to name a few organic compounds.

**Alkanes** consist of only carbon and hydrogen and all the bonds are single.

Prefixes for alkanes

meth- means one carbon

eth- means two carbons

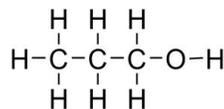

prop- means three carbons

Name	Formula	Structural Formula
Methane	$CH_4$	$\begin{array}{c} H \\   \\ H-C-H \\   \\ H \end{array}$
Ethane	$C_2H_6$	$\begin{array}{c} H & H \\   &   \\ H-C & -C-H \\   &   \\ H & H \end{array}$
Propane	$C_3H_8$	$\begin{array}{c} H & H & H \\   &   &   \\ H-C & -C & -C-H \\   &   &   \\ H & H & H \end{array}$

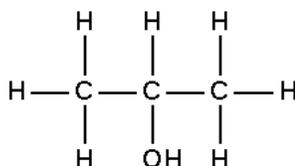

**Alcohols** have an  $-OH$  group bound to a carbon atom. The name ends in  $-ol$ . With propanol, locant numbers are used to distinguish whether the  $-OH$  group is on C-1 or C-2. Locant numbers are always separated from letters with a dash.

Methanol	$CH_4O$ or $CH_3OH$	$\begin{array}{c} H \\   \\ H-C-O-H \\   \\ H \end{array}$
Ethanol	$C_2H_6O$ or $C_2H_5OH$	$\begin{array}{c} H & H \\   &   \\ H-C & -C-O-H \\   &   \\ H & H \end{array}$

1-Propanol  $\text{CH}_3\text{CH}_2\text{CH}_2\text{OH}$

2-Propanol (isopropyl alcohol)  
 $\text{CH}_3\text{CHOHCH}_3$

## Helpful Reference Materials

COMMON IONS		
<b>Positive Ions (Cations)</b>		
<b>1+</b>	Mercury(II) or mercuric ( $\text{Hg}^{2+}$ )	Hydrogen sulfite or bisulfite ( $\text{HSO}_3^-$ )
Ammonium ( $\text{NH}_4^+$ )	Strontium ( $\text{Sr}^{2+}$ )	Hydroxide ( $\text{OH}^-$ )
Cesium ( $\text{Cs}^+$ )	Nickel(II) ( $\text{Ni}^{2+}$ )	Iodide ( $\text{I}^-$ )
Copper(I) or cuprous ( $\text{Cu}^+$ )	Tin(II) or stannous ( $\text{Sn}^{2+}$ )	Nitrate ( $\text{NO}_3^-$ )
Hydrogen ( $\text{H}^+$ )	Zinc ( $\text{Zn}^{2+}$ )	Nitrite ( $\text{NO}_2^-$ )
Lithium ( $\text{Li}^+$ )	<b>3+</b>	Perchlorate ( $\text{ClO}_4^-$ )
Potassium ( $\text{K}^+$ )	Aluminum ( $\text{Al}^{3+}$ )	Permanganate ( $\text{MnO}_4^-$ )
Silver ( $\text{Ag}^+$ )	Chromium(III) or chromic ( $\text{Cr}^{3+}$ )	Thiocyanate ( $\text{SCN}^-$ )
Sodium ( $\text{Na}^+$ )	Iron(III) or ferric ( $\text{Fe}^{3+}$ )	<b>2-</b>
<b>2+</b>		Carbonate ( $\text{CO}_3^{2-}$ )
Barium ( $\text{Ba}^{2+}$ )	<b>Negative Ions (Anions)</b>	Chromate ( $\text{CrO}_4^{2-}$ )
Cadmium ( $\text{Cd}^{2+}$ )	<b>1-</b>	Dichromate ( $\text{Cr}_2\text{O}_7^{2-}$ )
Calcium ( $\text{Ca}^{2+}$ )	Acetate ( $\text{C}_2\text{H}_3\text{O}_2^-$ )	Hydrogen phosphate ( $\text{HPO}_4^{2-}$ )
Chromium(II) or chromous ( $\text{Cr}^{2+}$ )	Bromide ( $\text{Br}^-$ )	Oxide ( $\text{O}^{2-}$ )
Cobalt(II) or cobaltous ( $\text{Co}^{2+}$ )	Chlorate ( $\text{ClO}_3^-$ )	Peroxide ( $\text{O}_2^{2-}$ )
Copper(II) or cupric ( $\text{Cu}^{2+}$ )	Chloride ( $\text{Cl}^-$ )	Sulfate ( $\text{SO}_4^{2-}$ )
Iron(II) or ferrous ( $\text{Fe}^{2+}$ )	Cyanide ( $\text{CN}^-$ )	Sulfide ( $\text{S}^{2-}$ )
Lead(II) or plumbous ( $\text{Pb}^{2+}$ )	Dihydrogen phosphate ( $\text{H}_2\text{PO}_4^-$ )	Sulfite ( $\text{SO}_3^{2-}$ )
Magnesium ( $\text{Mg}^{2+}$ )	Fluoride ( $\text{F}^-$ )	<b>3-</b>
Manganese(II) or manganous ( $\text{Mn}^{2+}$ )	Hydride ( $\text{H}^-$ )	Arsenate ( $\text{AsO}_4^{3-}$ )
Mercury(I) or mercurous ( $\text{Hg}_2^{2+}$ )	Hydrogen carbonate or bicarbonate ( $\text{HCO}_3^-$ )	Phosphate ( $\text{PO}_4^{3-}$ )

## NOMENCLATURE WORKSHEET

**Name the following ionic compounds. Complete before leaving lab.**

$\text{KMnO}_4$  \_\_\_\_\_  $\text{Al}(\text{NO}_3)_3$  \_\_\_\_\_

$\text{Na}_2\text{CrO}_4$  \_\_\_\_\_  $\text{MgO}$  \_\_\_\_\_

$\text{AgCl}$  \_\_\_\_\_  $\text{AlN}$  \_\_\_\_\_

$\text{Na}_2\text{O}$  \_\_\_\_\_  $\text{Ca}_3(\text{PO}_4)_2$  \_\_\_\_\_

$\text{NaC}_2\text{H}_3\text{O}_2$  \_\_\_\_\_  $\text{K}_3\text{N}$  \_\_\_\_\_

$\text{CuSO}_4$  \_\_\_\_\_  $\text{LiH}_2\text{PO}_4$  \_\_\_\_\_

$\text{Sn}(\text{ClO})_4$  \_\_\_\_\_

**Give the formula for the following ionic compounds.**

Sodium carbonate \_\_\_\_\_

nickel (III) sulfide \_\_\_\_\_

Sodium bicarbonate \_\_\_\_\_

Calcium sulfide \_\_\_\_\_

Calcium sulfate \_\_\_\_\_

Iron (III) hydroxide \_\_\_\_\_

**Name the following molecules.**

H<sub>2</sub>O \_\_\_\_\_ NH<sub>3</sub> \_\_\_\_\_

PCl<sub>5</sub> \_\_\_\_\_ Cl<sub>2</sub>O<sub>7</sub> \_\_\_\_\_

O<sub>2</sub> \_\_\_\_\_ P<sub>4</sub>O<sub>10</sub> \_\_\_\_\_

Cl<sub>2</sub> \_\_\_\_\_ H<sub>2</sub> \_\_\_\_\_

N<sub>2</sub>O<sub>5</sub> \_\_\_\_\_ H<sub>2</sub>O<sub>2</sub> \_\_\_\_\_

CO \_\_\_\_\_ SO<sub>2</sub> \_\_\_\_\_

10

**Write the formula for the following molecules.**

Antimony tribromide \_\_\_\_\_

Pentaphosphorus pentoxide \_\_\_\_\_

Phosphorus triiodide \_\_\_\_\_

Tetraphosphorus pentasulfide \_\_\_\_\_

Nitrogen trifluoride \_\_\_\_\_

## Name the following acids

H<sub>2</sub>SO<sub>4</sub> \_\_\_\_\_

HCl \_\_\_\_\_

HClO<sub>4</sub> \_\_\_\_\_

HBr \_\_\_\_\_

HI \_\_\_\_\_

HNO<sub>3</sub> \_\_\_\_\_

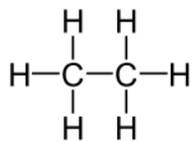

HClO<sub>3</sub> \_\_\_\_\_

HC<sub>2</sub>H<sub>3</sub>O<sub>2</sub> or CH<sub>3</sub>COOH (or HOAc) \_\_\_\_\_

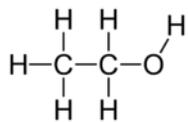

11

## Name the following organic molecules

CH<sub>4</sub> \_\_\_\_\_

C<sub>2</sub>H<sub>6</sub> \_\_\_\_\_

, CH<sub>3</sub>CH<sub>2</sub>OH \_\_\_\_\_
